Tax paid by the buyers: what they pay in all

A town taxes bike rentals: renters pay the tax at a machine, on top of the shop's price. Solid demand line: what renters are willing to pay in all. Dashed line: demand at the shop after the tax. Which point shows the total a renter pays (shop price plus tax) and the number of rentals?

Who bears the tax, and why

Riders pay a €0.50 tax per e-scooter ride in the app. They can easily walk or take the bus (demand elasticity 2.0); operators cannot quickly change their fleets (supply elasticity 0.5). Who bears most of the tax, and why?

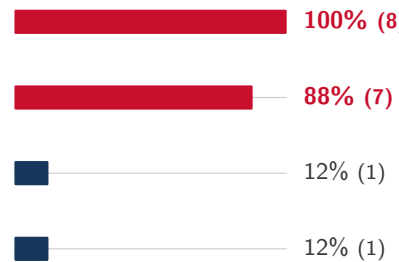

Consumer surplus: add the buyers' gains

Four shoppers at a market stall each want one melon at most; the most each would pay for it is €7, €5, €4 and €2. A melon costs €3. What is the consumer surplus at this stall?

Which price cuts raise revenue (select all that apply)

A park hires out rowing boats. Which of these price cuts would raise its revenue (price × hires a day)?

exact set correct: 88% · **average credit: 88%** · the shares add to more than 100 %: several circles could be marked

Opportunity cost between two plans

A farm can grow 100 tonnes of barley and no chickpeas, or 90 of barley and 10 of chickpeas, or 70 of barley and 20 of chickpeas. It switches from the second plan to the third. What does each extra tonne of chickpeas cost it?

Hardest three

Tax paid by the buyers: what they pay in all — 12% correct

point D: on the old demand curve straight above the new crossing, the shop's price plus the tax

most chosen instead: point A: the new crossing, the shop's price (88%)

Who bears the tax, and why — 38% correct

the operators: their supply is less elastic than the riders' demand

most chosen instead: the riders: their demand is more elastic (62%)

Consumer surplus: add the buyers' gains — 50% correct

€7: the three who buy gain €4 + €2 + €1; the €2 shopper does not buy

most chosen instead: €16 (25%)
