Per question, % exactly right — hardest first

The three hardest

Question	correct	The answer	Most chosen wrong answer
Same costs, no gains from trade	25%	nothing: a cake costs 2 loaves in both shops, so total output cannot rise	gains for both, if each specialises in one good (33%)
What moved the frontier	33%	better grapes, or a new terrace where only vines grow: only the wine end moves	new workers join both vineyards and olive groves (33%)
Two frontiers: absolute vs comparative	42%	Ona has the absolute advantage in both; Hugo the comparative advantage in posters	trade cannot help Ona: she is faster at both (33%)

Easiest three: Which part could data settle (75%), Circular flow: land and rent (58%), Opportunity cost between two points (58%)

The answers, and why

Your sheet showed the questions, and their options, in a shuffled order, so look for the topic. Percentages: share of the 12 strips exactly right. + select all that apply: the point needed exactly the two correct statements.

-
- Q1 Which part could data settle** 75 % exactly right
Answer: that more bike lanes will cut car traffic
"Will cut car traffic" is a positive claim that data can test; "should build" is a normative judgement.
-
- Q2 Same numbers, different advice** 50 % exactly right
Answer: they value fewer crowds and lost jobs differently
They agree on the facts, so what divides them is values: how they weigh fewer crowds against lost jobs.
-
- Q3 Opportunity cost between two points** 58 % exactly right
Answer: 1.25 thousand tonnes of rice
From D to C: 8 thousand tonnes more vegetables for 10 less rice, so each thousand costs $10 \div 8 = 1.25$ of rice.
-
- Q4 Two frontiers: absolute vs comparative +** 42 % exactly right
Answer: Ona has the absolute advantage in both *and* Hugo the comparative advantage in posters
Ona makes more of both, but a poster costs Hugo $\frac{1}{4}$ logo and Ona $\frac{1}{2}$: Hugo is the cheaper poster-maker.
-
- Q5 The price at which both gain** 50 % exactly right
Answer: 3 kg of tomatoes for 1 kg of fish
A kilo of fish costs Norway 2 kg of tomatoes and Morocco 4 kg; a price in between, such as 3, suits both.
-
- Q6 What moved the frontier +** 33 % exactly right
Answer: a new grape variety *and* a new terrace where only vines can grow
Only the wine end moved (4 to 6), so it helps wine alone; new workers in both would move both ends.
-
- Q7 Consuming beyond the frontier** 42 % exactly right
Answer: 360 tonnes
It pays $16 \times 15 = 240$ t of cheese for the shoes and keeps 360 t (on its own frontier: only 120 t).
-
- Q8 Circular flow: land and rent** 58 % exactly right
Answer: land on arrow 3, rent on arrow 1
The land's use goes to the factor market (arrow 3); the rent comes back to households as income (arrow 1).
-
- Q9 Injections into the loop +** 42 % exactly right
Answer: the German firm buying in Terrassa *and* the Generalitat's school repair
An export and government purchases bring money into the loop; an import and a tax take it out (leakages).
-
- Q10 Same costs, no gains from trade** 25 % exactly right
Answer: nothing: their total output cannot rise
A cake costs 2 loaves in both: no comparative advantage, so specialising adds nothing. Size is no advantage.
-
